Professional objective

Analytical and motivated Computer Science student passionate about Artificial Intelligence and Machine Learning, currently working towards becoming a game developer. Seeking an opportunity at entry level job in game development or any related field where I can contribute to projects.

Education

Don Bosco Institute of technology, Bachelors of Engineering in July 2022 – June 2026

Computer Science(Artificial Intelligence and Machine Learning)

- **Coursework:** C programming language, Python Programming, Data Structures Algorithms, Machine Learning, Artificial Intelligence.

Skills

Programming Languages- C#, python.
Tools- Unity game engine, AI Tools.

Projects

Artificial Intelligence-driven Role Playing Game Using Unity Sep – Dec 2024

- Built an immersive role playing game with intelligent NPCs using FSMs for adaptive decision making and A* for efficient pathfinding in dynamic environment.
- Tools Used: C#, Unity game Engine.

Automated Model Compression For Deep Learning May 2025 – Nov 2025

- Developing a system to automatically reduce the size and computational cost of deep learning models using techniques like pruning, quantization, and knowledge distillation. Enhanced model efficiency while maintaining high accuracy across benchmark datasets. Implemented automated pipeline for compression and performance evaluation. Optimized deployment of compressed models for real-world edge and cloud applications.

Personal Projects:

Chain Reaction – A small freelancing project that I made which includes How UI textMeshPro works and UI Panel that are usually used to show Score in-game and display buttons as well in mobile games.

Pilot - My First Launched Physics-Based Game in Unity.

🎮 About the Game
The objective is simple but challenging - control a rocket using thrust and rotation, navigate through obstacles, and land safely on the target platform. The game is physics-driven, so mastering movement, balance, and timing is key to success.

You can play this game at – itch.io
